Learning Diary

The learning from the whole course basically to me were the lectures and discussions during the classes. We got to engage in new topics, the most interesting way was exploring the concepts of project management and definitions heard from different perspective. I have no doubt that the learning was entertaining now as I feel more comfortable and interested in the discussion during the classes. The learnings I consider were mostly from the lecture-time therefore, I should categorize by the weekly lectures below and give some briefing accordingly.

Week 1:

- Decided to use OpenAI ChatGPT for the documents required by the course.
- Created an account and did some initial work on assignment 1.
- Explored the functionalities of ChatGPT and Dall-E.

Week 2:

- Completed assignment 1 and submitted it.
- Received feedback on the assignment and made necessary improvements.
- Discussed the limitations of ChatGPT in terms of generating specific content.

Week 3:

- Attended a CEO and employees meeting where we learned the importance of making logical decisions, based on the current scenario and facts, rather than emotions.
- Completed assignment 2, which was fun but had some challenges with the AI thinking we wanted to build a new library.

Week 4:

- Familiarized ourselves with user interface design, discussing its evolution since the 1990s and the rules from the book by Shneiderman and Plaisant.
- Completed assignment 3, which involved using UI design tools and exploring new tool-names.

Week 5:

- Covered two-week lessons on DevOps and CI/CD and got familiarized with new tools.
- Discussed the final presentation and its subject matter. One person from each group will deliver it.

Overall, the course has been informative and challenging. We have learned new tools and techniques that will be useful in our future endeavors. The assignments have been fun, and the feedback provided has helped us improve our work.
